The Camera Raw Editor, new in CS6, is my all-time favorite feature in Photoshop. I don't use it all the time, but it's great when I do. In short, the Camera Raw Editor is a digital camera control panel that allows users control over the RAW settings of a camera. Then you can save those settings as a Single File or Targeted Adjustment Layer, making them available whenever you want. But the real magic happens when you enable Irradiance correction and Overexposure/Underexposure correction. I mean, I know there are some presets that can achieve these results, but when I see something like an image with color ripples that have been eliminated, it means that I finally achieved that dream of getting an 'out-of-box' photo ready for the day the photographer is back from vacation. You can now keep a history of changes to a document. You can also undo changes in the past. Color Correction is one of those features. The Red Eye Correction tool has been slightly redesigned, too. You can now reduce the effects in clusters. You can now also duplicate them into the same settings. You can also modify the Detail slider up to 100%. This may make you feel like Photoshop is lifting a veil on necessary parts of color correction for you, letting you see the truth to it. Instead of simply creating the same effect with a different Detail option, you can duplicate the existing parameters and modify them to your liking. A new feature, \"Quick Select,\" lets you click in a selected area to add it to a rectangular selection. You can have the rectangle move with the object, follow it as it moves across the screen, and disappear behind that object when it hits the edge of the screen. I haven't had the time to make use of this feature yet but it looks handy. There are a number of new Preset categories adorning the Normal, Expert, Smart, and Standard panels. You can now also store the brush settings in the brush collection. And, I'm not entirely sure if this is new or not, but you can create a custom brush. It's kind of hard to believe that it's not new. Photoshop Elements has supported custom brushes for several years. It's a nice improvement for Lightroom.
